

## Dry eyes – patient information

Having dry eyes is a very common condition that occurs when the eyes don't make enough tears, or the tears evaporate too quickly. This leads to the eyes drying out and becoming red, swollen and irritated. Dry eye can also be called keratoconjunctivitis sicca or simply “dry eye syndrome”.

Some possible causes of dry eyes include:

- Hormonal changes
- Ageing – as you get older the body produces less tears and eyelids can't spread tears over the surface of your eyes as well as before
- Exposure to the sun, wind or a dry climate may cause tears to evaporate
- Activities such as reading, writing or working on a computer may mean you blink less often
- Side-effects of some medication
- Laser eye surgery
- Wearing contact lenses
- Medical conditions such as blepharitis, Sjögren's syndrome, contact dermatitis or arthritis.

### Taking care of your eyes – self care

Taking care of your eyes is a personal responsibility. Dry eyes are usually a chronic condition and although there is no cure there are things that you can do yourself to help your eyes feel more comfortable and ease symptoms. In mild cases self care may be all you need.

Things you can do include:

- Keeping your eyes clean and maintaining good eyelid hygiene, particularly if you have blepharitis.
- Keeping your eyes protected from wind, dust or other air which can irritate your eyes
- Avoid using eye make-up which can block glands that naturally lubricate your eyes
- Limiting contact lens use to shorter periods, especially if these cause irritation
- Avoiding smoky environments – and stopping if you smoke
- Using a humidifier to moisten the surrounding air and avoiding too much time in places with air-conditioning
- Drinking plenty of water
- If you use a computer for long periods, place your monitor at or below eye level, avoid staring at the screen, and take frequent breaks
- 

**And don't forget to blink, as this helps prevent your eyes drying out.**

Treatments for treat dry eyes include artificial tears, tear replacement and “ocular lubricants” – usually in the form of eye drops or gels. If, after trying the self-help methods, you still have symptoms of dry eyes then you can try any of the treatments on the following pages.

You can buy these treatments from your pharmacy over the counter (OTC) or at the supermarket. Your pharmacist can advise you on which type of eye product is best for you.

### How to administer eye drops and eye gels:

- Always wash your hands before and after using eye products
- Tilt your head back a little and pull the lower lid of your eye out to form a “pocket”
  - Administer eye drops into the pocket of the eye.
  - For gels, apply a thin line of gel along the inside of the lower eyelid.
- Close your eyes for a moment and blink to spread the gel. Try not to rub your eyes. Repeat on the other eye.
- To reduce contamination of the bottle, avoid touching the surface of your eye with the nozzle

### Example products – other brands are available

Type of treatment	Brands (examples)*	Other useful information
Hypromellose eye drops 0.3% or 0.5% 	Generic (£3.49) Isopto Plain® (£1.50)	<ul style="list-style-type: none"> <li>• Most people can take Hypromellose</li> <li>• Use every hour for the first day until your symptoms improve and reduce the number of times you take to 4 times a day</li> </ul>

Finding an effective treatment can vary between people. If one doesn't work then others can be tried until you find the right one for you. A proper trial of one product would be for at least 6 to 8 weeks.

If your symptoms change or worsen then you should see your GP.
